

COP 3363

SPRING 2020

RECITATION 1

UNIX BASED OPERATING SYSTEMS

- ▶ Why are we learning this and why is the OS important?
 - ▶ Has been in use since the 1970s
 - ▶ Many versions (flavors) available running on a wide variety of machines world wide
 - ▶ Raspbian - Linux derivative designed for RaspberryPi
 - ▶ ~98% of all publicly accessible servers on the Internet use a Unix or Unix-like OS
 - ▶ As of 2017 the 500 fastest supercomputers in the world all run some version of Linux

THE COMMAND LINE INTERFACE (CLI)

- ▶ Again, why are we learning this and why is the CLI important?
 - ▶ CLIs have existed since the 1960s
 - ▶ Widely used in a non personal-computing context
 - ▶ Can perform actions on a machine which a GUI cannot
 - ▶ Nerd cred

LINPROG

- ▶ A collection of servers running Linux
 - ▶ Used by faculty and students to compile and run code
 - ▶ Use a command line application and the Secure Shell protocol to connect to the server
 - ▶ macOS | Linux - Terminal application
 - ▶ Windows - Tectia
 - ▶ `ssh <cs username>@linprog.cs.fsu.edu`
 - ▶ ex. `ssh mcinnest@linprog.cs.fsu.edu`

BASIC COMMANDS

- ▶ Interact with the machine by issuing it commands
 - ▶ Commands are typically accompanied by flags and sometimes with a string or input file as an argument
 - ▶ (Very basic) Format: `<command> -<flags>`
 - ▶ Unsure of how to use a command?
 - ▶ `man` - displays the documentation for a command and associated flags
 - ▶ ex. `man ls` displays the documentation for the `ls` command

LS

- ▶ Command which lists the contents of a directory (aka folder)
 - ▶ Useful flags
 - ▶ a - list the contents of a directory, including hidden files and hidden subdirectories
 - ▶ l - display a detailed listing of the directory contents
 - ▶ ex. ls -la
 - ▶ detailed list of all files and directories in the current directory

CD

- ▶ Command which changes your current working directory
 - ▶ ex. `cd test/`
 - ▶ Would make the current working directory test, assuming it is a directory within the current directory
 - ▶ `cd ~`
 - ▶ Changes your current working directory to your home directory

NANO

- ▶ One of multiple text editors which run in a CLI environment
- ▶ `nano <filename>`
 - ▶ opens the file `<filename>` in the nano editor
- ▶ `nano`
 - ▶ opens nano and a new temporary file which can be saved later
- ▶ Other editors exist (all have benefits and drawbacks)
 - ▶ Vi/Vim, Pico, Emacs

OTHER USEFUL UNIX COMMANDS

- ▶ touch <filename>
 - ▶ creates an empty file with name <filename> within the current directory, if the file does not exist
 - ▶ updates the files last modified timestamp if it does exist
- ▶ rm <filename>
 - ▶ remove the file with name <filename> in the current directory
- ▶ rmdir <directory name>
 - ▶ remove the directory with name <directory name> in the current directory
- ▶ mkdir <directory name>
 - ▶ create a directory named <directory name> in the current directory
- ▶ cp <filename1> <filename2>
 - ▶ copies the file <filename1> and names the copy <filename2>
- ▶ mv <filename1> <filename2>
 - ▶ renames the file <filename1> to <filename2>
 - ▶ if a path is included before <filename2> the new file will be moved to that directory

USEFUL UNIX FEATURES

- ▶ Tab completion
- ▶ Up/down arrows to view previous commands
- ▶ ! character followed by 1 or more characters finds the most recent command starting with those characters
 - ▶ ex. touch testfile
 - ▶ !to + <tab> or <enter/return> displays/runs touch testfile again

FILE TRANSFER

- ▶ How do I move files/folders to and from a server?
 - ▶ SFTP - Secure File Transfer Protocol
 - ▶ available from the command line
 - ▶ `sftp <username>@<server address>`
 - ▶ ex. sftp mcinnest@linprog.cs.fsu.edu
 - ▶ Use an SFTP GUI application such as FileZilla

CODING STYLE

- ▶ Practice using a clean and readable coding style
 - ▶ makes your code easier to debug
 - ▶ in the industry, makes the code you write more maintainable
 - ▶ you will typically be working in a team of programmers
- ▶ Utilize indentation to denote blocks of code
 - ▶ useful with loops and control flow statements (we will learn about these concepts later)

COMMENTS

- ▶ Learning to document (comment) code in a clean and useful manner is critical to becoming an effective programmer
- ▶ Comments help you (and more importantly) others understand what your program is doing at a given point
- ▶ The software you will work on after school will often be thousands or even millions of lines long
 - ▶ Microsoft Windows code base is comprised of 50+ million lines of code
 - ▶ As a professional, your time is valuable. A good comment can save hours of time trying to understand a code block.

VARIABLE NAMES

- ▶ Should be descriptive, but not too lengthy
 - ▶ try to name variables in a way which would make them understandable at first glance
 - ▶ ex. `int x;` vs `int taxRate;`
- ▶ Good naming styles: `taxRate`, `tax_rate`
- ▶ Const variables are often all uppercase
 - ▶ ex. `const int SIZE = 10;`
- ▶ Variable declaration should be done at the top of `main()`
 - ▶ makes it easier to identify all of the variables used in a program, along with their initial values

G++

- ▶ Open source C++ code compiler
 - ▶ converts the code you write into a useable program
- ▶ Useful flags
 - ▶ `-std=c++<version>` compiles using a specific version of C++
 - ▶ `-o <filename>` specify the name of the executable file the compiler creates
 - ▶ `-Wall` display a detailed list of compile warnings and errors
- ▶ ex. `g++ hello.cpp -o firstProg`
